

Severity Score for PA and MMA

Kimberly A Chapman, MD PhD,
Children's National Rare Disease Institute

Alberto Burlina, MD

Dipartimento di Pediatria-Università di Padova

Do we have the data in EIMD to predict how severe a patient will be over time?

- Definition of severe: repeated hospitalization, life-threatening complications (EKG, Cardiomyopathy, Renal failure)
- Our hypothesis is that those who present either prior to NBS results or in the first 30 days are more severe.

Cohort

Diagnosis	Time/method of diagnosis	Number of patients	Current median age (Years)
MMA	Newborn screening	25	9.128
	Selective screening	121	13.541
	Symptomatic 0-30 days	74	12.047
	Symptomatic 31 days to 4 months	9	13.708
	Symptomatic 4 months to 12 months	29	11.376
	Symptomatic 12 months to 24 months	11	21.046
	Symptomatic 2 years- 6 years	9	9.213
	Asymptomatic	14	9.003
PA	Newborn screening	38	9.834
	Selective screening	82	15.504
	Symptomatic 0-30 days	75	12.29
	Symptomatic 31 days to 4 months	14	13.96
	Symptomatic 4 months to 12 months	12	14.086
	Symptomatic 12 months to 24 months	4	16.047
	Symptomatic 2 years- 6 years	7	16.46
	Asymptomatic	8	8.003

Timing of presentation

MMA symptomatic

PA symptomatic

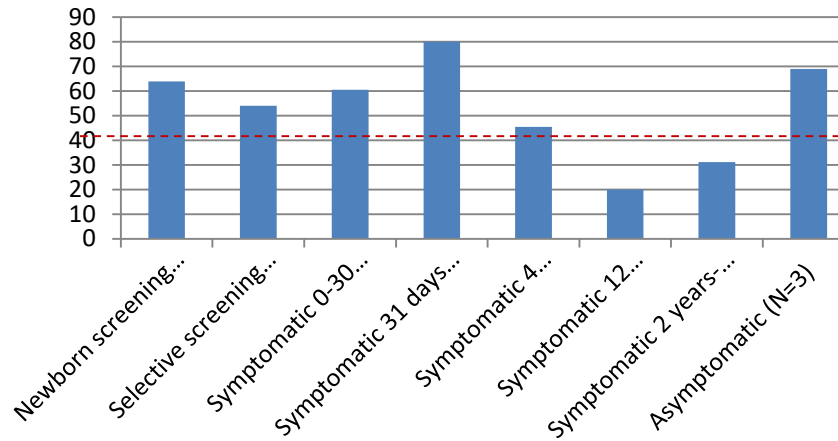

Diagnosis	Time of diagnosis	Median days in hospital (per year)	Regular visits	Emergency visits	Terminal disease visits
MMA	Newborn screening (N=25)	2.579	60	28	0
	Selective screening (N=121)	4.22	343	146	5
	Symptomatic 0-30 days (N=74)	5.012	219	112	2
	Symptomatic 31 days to 4 months (N=9)	19.13	24	5	1
	Symptomatic 4 months to 12 months (N=29)	1.547	98	30	2
	Symptomatic 12 months to 24 months (N=11)	1.97	14	3	0
	Symptomatic 2 years- 6 years (N=9)	4.457	16	8	0
	Asymptomatic (N=14)	0	32	16	0
PA	Newborn screening (N=38)	8.33	8	100	0
	Selective screening (N=82)	3.15	283	140	4
	Symptomatic 0-30 days (N=75)	4.261	243	185	2
	Symptomatic 31 days to 4 months (N=14)	6.275	17	1	2
	Symptomatic 4 months to 12 months (N=12)	1.811	58	16	0
	Symptomatic 12 months to 24 months (N=4)		9	0	0
	Symptomatic 2 years- 6 years (N=7)	9.92	8	8	0
	Asymptomatic (N=8)	3.451	28	30	0

Age (years)	Number	“Abnormal”	CM	Total
<1	2	1 (50%)	0	50%
1-6	15	2 (13%)	1 (7%)	20%
6-12	16	1 (6%)	1 (6%)	12%
12-18	11	1 (9%)	0	9%
>18	13	1 (8%)	3 (23%)	31%

MMA

Age (years)	Number	“Abnormal”	CM	Total
<1	3	0	0	0%
1-6	15	3 (20%)	2 (13%)	33%
6-12	18	4 (22%)	2 (11%)	33%
12-18	11	2 (18%)	1 (9%)	27%
>18	14	7 (50%)	3 (21%)	71%

PA

Summary

- Presentations between 31 days and 4 months has the highest ammonias (for PA), elevated C3 (MMA), most hospitalizations (MMA)
- Cardiomyopathy or abnormal ECHOs may be age related, similar to EKG findings
- EKG and ECHOs done and recorded in early ages, appear to be related to symptoms.

Next to do

- Awaiting results which give the spread of the abnormal findings (are the means/medians caused by a non-normal distribution)?
- Should also look at acidosis (pH and CO₂) and neurological outcomes (if available)
